Description

Last semester, I worked on a group data analysis project investigating the cost-effectiveness of fully furnished and unfurnished rental properties for expatriates. I was responsible for data cleaning, visualisation, and interpreting the results. Together, we presented our findings to the class.

Feelings

At first, I was motivated to apply the data analysis skills learned in class. However, I became frustrated because different coding styles within the team made collaboration less efficient. By the end of the project, I felt more confident as my time management and communication skills improved.

Evaluation

Overall, the project was successful because we answered our research question using evidence from data analysis and presented our findings clearly. However, communication could have been improved, as resolving inconsistencies in coding style and documentation limited the time for deeper analysis.

Analysis

This was a positive experience as it showed me that technical ability alone is not enough for successful IT projects. I realised that even technically capable teams may become less efficient without clear communication and shared working practices. I learned that successful teamwork depends not only on technical skills but also on clear communication, consistent documentation, and adaptability.

Conclusion

In conclusion, this project strengthened both my technical and interpersonal skills. I became more adaptable and confident when working with teammates who had different working styles, and I am better prepared to contribute effectively to future team projects. It has helped me develop a more collaborative and professional approach to teamwork.

Action Plan

In future projects, I will encourage the team to establish coding conventions, documentation standards, and task responsibilities early. I will also use Git consistently, hold progress meetings, and seek feedback to improve collaboration and project outcomes.
